

A catalog of decision patterns

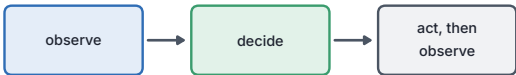

1 Extract, then decide

LLM fields into Jev: AUC 0.865, against 0.711 when the LLM decides alone. Real fields still win: 0.892.

2 The decide step

About 5.3 small decisions per alert. Send them to a decision model; keep the LLM for writing.

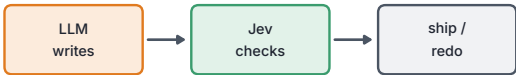

3 Guardrail gate

Check actions on trusted facts only. In Chapter 14, that kept auto-close at 14% under injection, not 50%.

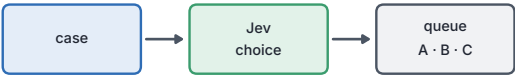

4 Check the writer

Ask typed questions about the draft. Redraft once; then a person.

5 Router

Route when the top label is at least 0.8: 80% routed, 94% to the right team.

6 Memory controller

Store, fetch and forget are decisions too, and there are lots of them.
