I We learned to speak in probabilities, check that they are calibrated, and turn them into actions.

II Networks learned patterns, LLMs learned to write, and agents to act.

III A new kind of model decides in one pass, and we learned to test its probabilities ourselves.

IV We compared methods, set thresholds from costs and named the patterns.

V We followed one team from shadow mode to a reliable service, and saw the same design in other fields.

VI Now decisions are cheap. The question is which ones deserve them.
