Anyone can build the demo.
This book is about what comes after.

A weekend chatbot answers "Can I return opened earbuds?" with a confident yes. The bill arrives at five times the estimate. Nobody can say whether last week's prompt change helped. *Ship Real AI* is the complete path from first principles to production, built around one system you grow module by module, with every number measured and every line of code run before it was printed.

- Build one real system, a support assistant for an Indian marketplace, from its first API call to a service in production.
- Learn how LLMs read, write and cost, in tokens and in rupees, including what Hindi and Hinglish do to the bill.
- Master context, memory, tools, structured output, search, RAG and the evals that prove each change helped.
- Design agents that act safely: guardrails, private data, prompt injection, approvals people actually read.
- Connect everything with MCP, skills and agent protocols, and run long jobs that survive crashes.
- Ship it: caching, concurrency, cost per correct answer, traces, safe releases, fine-tuning and open models.
- Finish with system design and interview questions worked as reasoning chains.

SRIDHAR MUKKANDI

is an applied AI engineer who builds AI agents and the decision systems behind them. He writes for engineers who want AI systems they can trust in production.
