

The type system: choice, score, noul

1 Three types cover a lot

Yes/no (noul), pick one (choice), a level on a scale (score). Most small decisions are one of these, or a few together.

2 Say what yes means

One fact per noul. Describe the yes and no cases. Avoid double negatives and bundled questions.

3 Give every case a label

Remove “benign” and harmless alerts still get a threat label, with median confidence 0.95. Probabilities sum to 1 over the options you gave.

4 Use the whole distribution

Pick the action with the lowest expected cost, not the label with the highest probability.

5 Averages hide tails

One alert’s average severity was 1.05 (“low”), with a 37% chance of medium or high. Act on $P(\text{level} \geq 2)$, not the mean.

6 Ask several at once

One call, one state, many typed questions, and a typed response model in your code.
