THE AI ENGINEER BOOTCAMP

Anyone can build the demo.
This book is about what comes after.

A weekend chatbot answers "Can I return opened earbuds?" with a confident yes. The bill arrives at five times the estimate, and nobody can say whether last week's prompt change helped. *Ship Real AI* is the complete path from first principles to production, built around one system you grow module by module.

- **Build one real system:** a support assistant for an Indian marketplace, from its first API call to a service in production.
- **Understand the model:** how LLMs read, write and cost, in tokens and in rupees, and why more context can mean worse answers.
- **Master the core skills:** context, memory, tools, structured output, search, RAG, and the evals that prove each change helped.
- **Make agents safe:** guardrails, private data, prompt injection, least privilege, and approvals people actually read.
- **Connect and scale:** MCP, skills and agent protocols, long jobs that survive crashes, caching and cost per correct answer.
- **Ship and get hired:** traces, safe releases, fine-tuning, open models, and system-design interviews as reasoning chains.
