

First calls, and the mock that makes them free

1 One line switches mock and real

Pass `transport=MockJevTransport()` to the official client. Remove it, add a key, and the same code calls the API.

2 The mock behaves like the API

Same request shape, same validation errors, same typed answers. Deterministic, free, offline.

3 Retries are built in

With 20% of requests failing, 79% of calls succeed with no retries and 99.2% with the default two.

4 Some errors should never be retried

Bad keys, unknown models and malformed questions fail fast. Fix the code, not the network.

5 Ask together

Four questions in one call: about 179 tokens. In four calls: 343. The state is sent once.

6 Record once, replay forever

Record real answers to a file once; replay them in every test run, with no key and no cost.
