THE AI ENGINEER BOOTCAMP

Your AI demo works.
Production is a different job.

The chatbot invents a refund policy. The bill comes in at five times the estimate. A prompt change ships and nobody can say if it helped. *Ship Real AI* teaches the engineering that fixes this, by building one real system, step by step, from the first model call to a service running in production.

YOU WILL LEARN TO

- Control what the model sees: prompts, context, memory and caching
- Build retrieval that finds the right answer: hybrid search, reranking, RAG
- Prove every change with evals, golden sets and LLM judges
- Design agents that act safely, with guardrails and human approval
- Connect tools with MCP, and run long jobs that survive failure
- Cut cost and latency, release safely, and know when to fine-tune
- Answer AI system-design questions in interviews
