

A hybrid agent: Jev decides, the LLM reasons

1 Decide, then write

Every choice in the loop is a typed question to Jev. The LLM writes only what a person will read.

2 A bug that didn't crash

The first version never fetched threat intel, and auto-closed 23 real threats a day. Every answer was well-formed.

3 Watch each decision's answers

An option that is never chosen, or always chosen, is a warning. Chart every decision step's answers.

4 Don't decide what you can just do

A lookup cheaper than the decision about it should simply run. Fetching threat intel fixed the bug.

5 Hybrid against all-LLM

1.4 s against 6.2 s per alert. The LLM sent 530 alerts a day to a queue that takes 240.

6 The trace is the audit log

Every step, answer and probability is recorded. Explaining a decision means reading its trace.
