

Capstone: a production decision service

1 One config, one fingerprint

Model, calibration, lines and rules live in one versioned config. Every record says which one decided.

2 The dry run found a bug

A rule added after the lines were fitted pushed reviews to about 275 a day. Fitting with the rule brought them to 245.

3 Failure has a meaning

With 10% of calls failing, fallback to REVIEW sent 12 real threats to a person. Fallback to ACT would have closed them unseen.

4 The record is the explanation

State, answers, calibrated probability, zone and reason, for every decision, forever.

5 Monitors that raise flags

Queue over capacity, zone rates out of band, confirmed threats above prediction: each becomes a flag a person reads.

6 Shadow before switch

The new version agreed with the old on 96% of alerts. Look at the rest before you switch.
