

Case study: SOC alert triage

1 The old way hid its misses

Rules closed most alerts unseen. 25.1 real threats a day never reached a person, and nobody could see which.

2 The same team, a different order

With the same six analysts, the threats never seen fell to 6.4 a day, and the likeliest threats were looked at first.

3 Shadow mode first

For a week the system decided in silence while analysts worked as before. Compare, then switch on.

4 Pages beat queues

Escalated threats reach a person in about 15 minutes; queues are measured in hours.

5 Campaigns break base rates

A phishing campaign pushed reviews to 289 a day. Re-estimating the base rate and adding overtime on day 3 cut the misses.

6 The log is the product

Every decision is recorded with its state, answers and policy version. That is what you show an auditor.
